

Speaker 1: "...with dyslexia have low working memory and have difficulties paying attention, and if they have to do an exploratory search that spans across multiple sessions, it's difficult for them to pick up that second session because they'll have forgotten the details of what the previous one was."

Speaker 1: "So not only do we need to remind them about that, but we also know that sometimes doing that next session, doing cross-session searching, isn't about picking up where you left off, sometimes it's about doing the next thing or something new. So this aligns with metacognitive planning, this aligns with cross-session searching, this aligns with the reasons why people do cross-session searching."

So if we want to think about what the problem is. Problem is that people sometimes have low working memory, that can lead to attention difficulties, that can lead to cross-session searching where the cross-session could be minutes away—"

Speaker 1: "—or hours or days, and then the question is, how do we help those people either resume what they're doing or identify that what they're doing they finished and they want to move on to something that is slightly different. Something that grasps or moves in the direction of another piece of that same information-seeking direction."
